Comment Text :

1 | --->Each state needs to bear the burden of storing it's own high and low level nuclear waste. The extreme hazzard potential to all U.S. citizens posed by shipping from 50 states to one location is totally unacceptable. The actual answer is to reprocess the high level to low level waste which can be shipped and stored more easily by each state. If only half of the money that has been spent already at Yacca Mountain was

1

cont [ used to build a reprocessing plant, the problem would be solved and each state could  
2 take care of it's self. [ If any of you think that the radiation from this high level  
1 cont storage will never get into ground water than you are dummer than I thought. [ Half  
life of the materials is the key to it. The stuff needs to be reprocessed into  
materials with a half life shorter than the life of the materials used to contain it. ]
